Orlando, FL | U.S. Citizen

Education

- B.S. Computer Science, University of Central Florida

August 2024

Work History

Software Developer at Sheefra Corporation, FL

August 2023 to Present

- Co-built the front end and back end of an internal transportation reporting app in PHP, MySQL, JavaScript, HTML, and CSS, replacing the spreadsheets staff used to email each other.
- Designed versioned REST APIs with token based authentication that served three internal apps and 25+ daily users, letting each app move to a new schema on its own schedule.
- Cut report load times from minutes to seconds with SQL query optimization and database indexing.
- Replaced direct FTP deploys with a Git workflow of pull requests and code review, putting a second reviewer on every change before it reached production.
- Integrated Google Cloud address autocomplete and map display into the checkout flow.

Projects

MARA, Multi-Agent Research Assistant

github.com/KTujjar/MARA

- Built the TypeScript, React, and CSS front end of a research assistant that planned a question, gathered its own evidence, and wrote a report, showing each step live as it ran.
- Designed a FastAPI REST API on a SQL database that streamed each run to the browser and stored it, so past questions and reports stayed browsable after the tab closed.
- Containerized the Python back end and web front end with Docker Compose.

Anomaly Detection Platform

github.com/KTujjar/anomaly-detection

- Developed a Python machine learning service that flagged anomalies in a live Kafka event stream and served its predictions through a FastAPI REST API.
- Gated every release on automated tests in a GitHub Actions CI/CD pipeline that then built the Docker image and smoke tested its health and prediction endpoints before publishing.
- Deployed the service to a local Kubernetes cluster that autoscaled from 2 to 10 replicas.

RocketDocs

- Built the TypeScript, React, HTML, and CSS front end of an AI documentation tool on a team of 5, turning a code repository into written docs.
- Reviewed pull requests on GitHub in a sprint based Agile workflow with that team.
- Created a RAG pipeline that fed an LLM retrieved chunks from a Firebase vector database, so users could ask questions instead of clicking through pages.

Skills

- Technical Skills: TypeScript, JavaScript, Python, PHP, SQL, MySQL, HTML/CSS, REST APIs, Git
- Tools & Frameworks: React, FastAPI, Kafka, Docker, Kubernetes, GitHub Actions, CI/CD, Agile
